System and Method for Using Shading Layers and Highlighting to Navigate a Tree View Display

RELATED APPLICATION

application is related to the following copending U.S. Patent Application filed on the same day as the present application: "System and Method for Using Layer Indicate Levels Within Non-Indented Tree View Control," (Docket No. RSW920000183US1), each with the same inventors and each assigned to the IBM Corporation.

10 BACKGROUND OF THE INVENTION

1. Technical Field

The present invention relates in general to a method and system for using color and highlighting to display a More particularly, the present view display. system and method for invention relates to a different values of color and/or highlighting providing a non-indented, layered representation of tree view data.

2. Description of the Related Art

Computer systems in general and International Business Machines (IBM) compatible personal computer systems particular have attained widespread use for providing computer power to many segments of today's modern society. Systems with microprocessors are finding themselves in an smaller specialized objects array of and more previously were largely untouched by computer technology. These devices are sometimes called "pervasive computing systems" because of their appearance as both traditionally

10

15

20

25

30

computerized devices, such as desktop computers, computers, and portable computers, as well devices such as telephones, appliances, computerized devices. Pervasive automobiles, and other computing devices generally include a system processor and associated volatile and non-volatile memory, a display area, means, and often interfaces, such as a network interface or modem, to other computing devices.

One of the distinguishing characteristics of these is the use of a system board to electrically connect these components together. Pervasive computing are "information handling systems" which devices designed primarily to give independent computing power to a single user, or a group of users in the case of networked computing devices. Pervasive computing devices are often inexpensively priced for purchase by individuals businesses. A pervasive computing device may also include one or more I/O devices (i.e. peripheral devices) which are coupled to the system processor and which perform specialized functions. Examples of I/O devices include sound and video devices specialized modems, or communication devices. Nonvolatile storage devices such as hard disks, CD-ROM drives and magneto-optical drives are also considered to be peripheral devices. computing devices are often linked to computing systems and other pervasive computing devices using a network, such as a local area network (LAN), wide area network (WAN), other type of network such as the Internet. By linking to computers including pervasive computing devices, pervasive computing device can use resources owned another computing device. These resources can include

10

15

20

25

30

files stored on nonvolatile storage devices and resources such as printers.

Pervasive computing devices are often designed perform a specialized function that has native applications related to the function being performed. For example, a cellular telephone may be a pervasive computing device and may have a telephone directory as a native application. The telephone directory application can store names and phone numbers the user of the cellular phone wishes to store for easy retrieval. Because pervasive computing devices are often portable devices, such as a "personal digital assistant" ("PDA") or mobile telephones. portable device, or as a device incorporated within a larger appliance, pervasive computing devices may have constrained displays in terms of both resolution and screen One challenge in using devices with constrained size. screens is being able to navigate through layered information.

One way in which layered, or hierarchical, information is presented is by using a "tree view" control to display the information to the user. A tree view control is a window that displays a hierarchical list of items, such as the headings in a document, the entries in an index, or the files and directories on a disk. Items displayed often include a label and an optional bitmapped image, and each item can have a list of subitems associated with it. By clicking an item, the user can expand or collapse the associated list of subitems. Figure 1a shows a traditional tree view control including how items and subitems are displayed in relation to one another.

10

15

20

limitless.

Traditional tree view window 100 shows example directories stored on a disk. Disk item 105, also called the "root directory," includes a bitmap representing a drive and a label ("Disk (c:)") corresponding to the disk. Two high level directories, directory 110 ("Parent A") and directory 130 ("Parent B") are shown within the root The hierarchical structure of the information directory. is depicted by showing the directories under the root directory and indented horizontally from the horizontal position of the root directory. Likewise, subdirectories of the two high level directories are shown under the respective high level directory and further indented horizontally from the horizontal position of the parent directory. For example, child directory 115 is shown below parent directory 110 as well as indented horizontally from the horizontal starting position of parent directory 110. Similarly, child directory 135 is shown below parent directory 130 as well as indented horizontally from the horizontal starting position of parent directory 130. Because any item can include subitems, the level of data shown, and the corresponding visual depth shown in the vertical and horizontal displacement, is virtually

As shown, child directory 115 has two subdirectories (grandchild directories 120 and 125) and child directory 135 has two subdirectories (grandchild directories 140 and 145). The grandchild directories, and their respective subdirectories, can have further subdirectories until all the data needed to be displayed is shown. If the 30 horizontal displacement of a subitem is outside the window area (tree view window 100), a horizontal scroll bar is

often placed on the bottom of the window to allow the user to scroll the display to show higher level items on the left side of the window or lower level windows on the right side of the window. Scrolling between high and low level information is challenging to the user because the visual relationship between data items is weakened when only high or low level information can be seen at a given time.

This challenge is exacerbated when the resources of the pervasive computing device are constrained. For example, because of the small form factor the display is often smaller than in monitors attached to traditional desktop systems. This constraint may prevent the pervasive computing device from displaying more than one or two layers in a traditional tree view control.

What is needed, therefore, is a way to display hierarchical relationships between items in a flat tree without needing to provide horizontal displacements to communicate the level of a particular item and its relationship with other items being displayed.

5

10

15

Ē)

10

15

20

SUMMARY

It has been discovered that hierarchical relationships and layered data can be displayed without providing a horizontal displacement between a higher level item and a 5 lower level subitem. Highlighting, such as color, layers of transparency, or grayscale fill, is used to visually identify items with a particular layer while virtual displacement is used to show which subitems belong to a higher level item. For example, the highest level items may be shown with a first fill color (e.g., yellow), the next, or second, level items are shown with a second fill color (e.g., orange), third level items are in turn shown with a third fill color (e.g., light blue), and fourth level items are shown with a fourth fill color (e.g., dark If color is not supported on the display, shades of gray can be used instead. In addition, various shades of a particular color can be used to indicate the level of the data. For example, if the color blue is being used as the highlighting color, the most transparent use of blue as a highlight could indicate the uppermost level hierarchy, with less transparent, or darker shades of blue, being used to indicate lower and lower levels within the hierarchy.

When visually using the flat tree control, levels are 25 identified by color. In the example described above, if the user sees a yellow filled item, he knows that the item is a high level item. If all the items shown are the same color then the user knows that he is looking at one layer If the fill color from one item to the next 30 changes, for example from yellow to orange,

10

15

20

25

30

understands that a level change is being shown. In the example described above, the orange item would be a subitem of the yellow item.

In another embodiment, shading is applied in an offset manner on a flat tree control structure. At least one edge of a level indicator, such as a bar or marker, is used to identify the item's level. Color and grayscale changes can be provided to further denote the level of a particular item. The horizontally displaced bars or markers enables a user to identify the layered relationships between tree view nodes even if the shading or colors between nodes is difficult to ascertain because of display limitations or the user's visual limitations.

By using color or grayscale changes to denote levels, groups of data are identified without using horizontal displacement. In addition, numeric level indicators can be provided to further note the various levels. The numeric level indicators may be well suited to environments in which the display resolution is poor or variations in shading or color is difficult to determine because of a user's visual limitations or other considerations.

Further highlighting is used to indicate attributes of a particular layer. For example, a particular fill color or shading can be used to denote the layer to which an item belongs, while a color can be added to note another attribute, such as whether an error has been found in the item, new information is located in the item, or to identify the importance of a particular item in relation to the other items within the same layer. The highlighting can be added so that the fill, or background, color

10

15

identifies an items layer with highlighting being added to the text characters comprising the item's label. Other highlighting, such as blinking, inverted text, bold text, and underlining can be used instead, or in addition to, changing an item's label color.

The foregoing is a summary and thus contains, by necessity, simplifications, generalizations, and omissions of detail; consequently, those skilled in the art will appreciate that the summary is illustrative only and is not intended to be in any way limiting. Other aspects, inventive features, and advantages of the present invention, as defined solely by the claims, will become apparent in the non-limiting detailed description set forth below.

20

25

DETAILED DESCRIPTION

The following is intended to provide a detailed description of an example of the invention and should not be taken to be limiting of the invention itself. Rather, any number of variations may fall within the scope of the invention which is defined in the claims following the description.

Figure 1a shows a prior art tree view control that uses horizontal item displacement denote lavers tọ and relationship with other items (see the background discussion for a more detailed discussion of Figure 1b). Figure 1b, in comparison, shows a flat tree view display of the same data displayed in Figure la. Flat tree view window 150 is noticeably narrower than indented tree view window 100 yet displays the same information regarding item layers and relationships. Comparing the placement of items depicted in Figure la with the placement of the same items in Figure 1b further illustrates the flat structure of the flat tree view control shown in Figure 1b. High level directory 155 ("Disk (c:)"), also called the root directory for the c: hard drive, is lightly shaded and includes a disk icon accompanying the label text. The next level data, directories 160 and 180 ("Parent A" and "Parent B," respectively) are shaded slightly darker than the previous layer (directory 155), indicating that directories 160 and 180 are subdirectories, or subitems, of directory 155. Likewise child directories 165 and 185 are slightly darker than their respective parent directories 160 and 180. Finally, grandchild directories 170, 175, 190, and 195 are

10

15

20

25

30

direting that they are

the darkest shaded items shown, indicating that they are the lowest level directories being displayed.

Figure 2 shows a sequence diagram of a user expanding a grayscale flat tree control by selecting various items. Window 200 shows a flat tree view control with multi-level expansion. Multi-level expansion allows the user to click on a high level item whereupon all the item's subitems are automatically opened (including "grandchildren," "greatgrandchildren," etc.). The user uses the keyboard or a selection device, such as a mouse, trackball, etc., to select an item he wishes to expand. In the example shown, the items shown in first screen 200 include root directory 205, parent A directory 210, parent B directory 215, child directory 220 (a subitem of parent B directory 215), and grandchild directories 225 and 230 (both of which are subitems of child directory 220). Icons can be used to inform the user as to whether a particular directory is opened. For example, parent B directory 215 has an open folder icon indicating that the subitems of the directory already being displayed. In contrast, parent directory 210 has a closed folder indicating that this directory has not been opened and, therefore, any subitems within this directory are not currently displayed in window To see the contents of parent A directory 210, the user selects the directory using a pointing device or keyboard. When the user moves his pointing device, arrow 201 correspondingly moves on screen 200. In the example shown, the user has moved arrow 201 over parent A directory 210 and selected the item, for example by clicking a button located on a mouse or trackball. In a multi-level expanding application, all subitems under parent A

10

15

20

25

30

directory 210 are shown after when the user selects parent A directory 210. Second screen 202 shows the result of the user selecting parent A directory 210. The icon shown with parent A directory 210 is changed from a closed folder icon to an open folder icon. Beneath parent A directory 210, subitems included with the directory are visible. Child directory 235 is shown. Because the application is a multi-level expanding application, the folders within child directory 235 are also shown. In this case, grandchild directories 240 and 245 are shown beneath child directory 235. In some multi-level expanding applications, a certain number of levels (e.g., up to 3 levels) are displayed when the user selects a higher level item. In some cases, the number of subitem levels that are opened is user selectable through a configuration or setup file.

Window 250 shows the same tree view control as shown in window 200. However, in the example shown in window 250, a single-level expansion is displayed (rather than the multi-level expansion shown in window 200 and 202). example shown, the items shown in first screen 250 include root directory 255, parent A directory 260, parent B directory 265, child directory 270 (a subitem of parent B directory 265), and grandchild directories 275 and 280 (both of which are subitems of child directory 270). the user selects parent A directory 260 by moving arrow 250 over the item and selecting the item, second screen 252 Second screen 252 shows the addition of child results. directory 285 under parent A directory 260. windows 250 and 252 show a single-level expansion example, only the next level beneath parent A directory 260 is Note that the icon corresponding to parent A shown.

10

15

20

25

30

directory 260 is now an open folder icon and the icon for the newly added child directory 285 is a closed folder icon. If the user selected child directory 285, the next level below child directory 285 would be displayed (such as

grandchild directories 240 and 245 shown in window 202).

Figure 3 is a sequence diagram showing a user expanding a color flat tree control by selecting various items. Windows 300 and 302 show a multi-level expansion (similar to windows 200 and 202 in Figure 2) whereas windows 350, and **354** show a single-level expansion (similar to windows 250 and 252 in Figure 2). The items shown in Figure 3 are similar to the items shown in Figure 2, however the level indication for Figure 3 utilizes color to indicate a particular items' level. Legend 399 shows fill patterns and the corresponding colors In the example shown, the items shown in first represent. screen 300 include root directory 305 which would have a yellow fill color, parent A directory 310 which would have an orange fill color, child directory 315 (a subitem of parent B directory 310) which would have a fill color of light blue, and grandchild directories 320 and 325 (both of which are subitems of child directory 315) which would have fill color of dark blue, and parent B directory 330 which would have an orange fill color. By looking at an item's color, the user quickly understands the hierarchy of the items, which items are subitems of other items, and which items are related. The yellow filled items are the highest level, followed by orange filled items, light blue filled items, and finally dark blue items. Of course, the color used for a particular layer can be most any color and in some implementations may be specified by the user. When

10

15

20

25

30

the user selects parent B directory 330 using a pointing device corresponding to arrow 301, second screen 302 would Similar to the multi-level expansion shown be displayed. in Figure 2, the multi-level expansion expands multiple levels beneath parent B directory 330. In this case, second screen 302 includes child directory 335, grandchild directories 340 and 345.

In a single-level expansion, a single level is shown beneath a selected item when the item is selected. Window 350 shows the same items as presented in window 300. However, in this example a single level, rather than multiple levels, are shown when an unexpanded level selected. Conversely, if a previously expanded item is selected, the levels underneath the selected item are removed from the screen and the selected item's icon changes from an opened folder to an unopened folder. window 350, the same items appear as were in window 300 355, parent A directory 360, child directory directory 365, grandchild directories 370 and 375, parent B directory 380 correspond to respective directories 305 through 330 shown in window 300). However, when parent B directory 380 is selected using arrow 351, only one additional layer underneath the selected directory shown. In this case, child directory 385 is shown in window 353. The icon corresponding to parent B directory 380 is now shown as opened and the icon corresponding to child directory 385 is shown as unopened. When child directory 385 is selected using arrow 352, an additional layer of items underneath directory 385 appear in window In this case, two additional directories, grandchild directories 390 and 395, appear.

10

15

20

25

30

Figure 4a is a diagram of a flat tree view control with highlighting to emphasize item attributes. Window 400 shows a flat tree view control with the same items as shown in window 202 in Figure 2. Root directory 405 is lightly shaded, parent directories 410 and 430 are the next layer under the root directory layer and are therefore slightly darker than root directory 405. parent directory has a child directory, 415 and 435, respectively, which are again slightly darker than the parent directories. Each child directory includes grandchild directories, 420 and 425 corresponding to child directory 415, and 440 and 445 corresponding to child directory 435, which are the most darkly shaded items shown in window 400.. In this example, however, emphasis of particular items is shown along with the layer of the item. Color legend 449 shows the emphasis being used in the Grandchild directory 425 is colored red which example. indicates that the directory is important, while child directory 435 is yellow indicating that errors have been identified in the directory. Other emphasis highlights can be used to indicate other features or attributes of given In addition, while color is shown as a highlighting tool, many other highlighting tools can be used. example, the text of the label (i.e., "Grandchild 2") can be emphasized using a color, underline, italics, or bold In addition, the icon can be modified to add a symbol or character indicating a condition. For instance, a red exclamation mark may indicate an important item, while a yellow question mark may indicate errors found within the particular item.

10

15

20

25

30

displays.

Figure 4b is a diagram of a flat tree view control including numeric layer identifiers. Some displays on pervasive computing devices may have poor contrast or color controls or may be used in light conditions in which the display screen is difficult to view. Also, some users may have visual impairments or be otherwise unable to easily distinguish between shading or color values indicate an item's level in comparison with other items In these cases, a numerical or shown on the screen. alphabetical level indicator can be added to provide additional visual cues to the user. In the example shown, window 450 includes the same items presented in window 400. However, to the left of each item a numerical level indicator is displayed. Root directory 455 is shown as the first level, parent directories 460 and 480 are shown as being in the second level, child directories 465 and 485 being in the third level, and grandchild are shown directories 470, 475, 490, and 495 are shown being in the fourth level. While drive and folder icons are also shown for each level, these icons could be removed to save horizontal display space, or the numeric level indicator could be included, or overlaid, on the respective icons. While the example shown is a grayscale example, the level

Figure 5 is a sequence diagram of a flat tree view control using layer bars superimposed on tree view item to identify the hierarchical structure. In this example, a layer bar is displayed with an item to provide a horizontal displacement reference regarding the items' respective levels without shifting the displayed text. The items

indicators would also work on colored flat tree view

10

15

20

25

displayed in window 500 are the same as the items displayed in window 200 in Figure 2. Root directory 505 has the longest overlay bar indicating that it is at the highest level of the hierarchy. Parent directories 510 and 515 are shown with overlay bars offset to the right from root directory 505 indicating that these directories are in the next layer of the hierarchy. Child directory 520 is shown with an overlay bar offset to the right from the parent directories indicating that this directory is in the next layer down from the parent directories. The overlay bars may be either overlaid on the text in such a fashion that the text is visible, or alternatively, the bars may be displayed as background fill with the text applied on top of the background fill. Finally, overlay bars included with grandchild directories 525 and 530 are offset from the overlay bar included with the child directory indicating that these directories are in an even lower layer of the hierarchy. When the user selects parent A directory 510 as shown by selection arrow 501, the items beneath the parent directory are displayed. Window 502 shows the resulting display with child directory 535 and grandchild directories 540 and 545 displayed with overlay bars corresponding to their respective levels. While the shading of the items shown is kept constant and the level is indicated using the offset bar, color or different level shading (as described in Figures 2 - 4) can be incorporated with the offset bar to provide additional visual cues to the user regarding the relationship between items and the hierarchy of the information.

30 Windows 550 and 552 show an analogous situation as shown in windows 500 and 502, except that in windows 550

10

15

20

25

30

hierarchy.

and 552 numeric level indicators are included in addition to the item names and offset bars. Window 550 shows the flat tree view control before expansion while window 552 shows the control following expansion. Root directory 555 is shown with its offset bar and a numeric indicator showing that it is the first layer of the hierarchy. Parent directories 560 and 565 are shown with the similar offset bars and a numeric indicator showing that these directories are in the second layer of the hierarchy. Child directory 570 is shown with its offset bar and a numeric indicator that it is in the third layer of the hierarchy. Finally, grandchild directories 575 and 580 are shown with similar offset bars and numeric indicators that these directories are both in the fourth layer of the

When the user selects parent A directory 560 using selection arrow 551, the items beneath the parent directory are displayed, as shown in resulting display 552. directory 585 is shown underneath parent A directory 560. Child directory 585 includes an offset bar indicating that it is in the same level of the hierarchy as child directory 570 and has the same level indicator showing that it is in the third level of the hierarchy. Grandchild directories 590 and 595 are shown under child directory 585 with offset bars and level indicators showing that these directories are beneath child directory 585 in the hierarchy. while the same shading is used for the offset bars, the bars can be colored or use different grayscales to further indicate the level and hierarchical relationships between Also, while a multi-level expansion is shown in Figure 5, a single-level or other type of expansion could

10

15

20

25

30

be used to display a single additional level or a fixed number of levels when an item is selected by the user. Furthermore, emphasis of a particular item within the tree view control can be added using the techniques described in Figure 4.

Figure 6a is a sequence diagram of a flat tree view control using layer markers superimposed on tree view item the hierarchical The to identify structure. information and sequencing shown in Figure 6a is similar to the item information shown and sequencing shown in Figure 3, windows 350, 353, and 354. In Figure 6a, window 600 shows a partially expanded tree view control. Instead of horizontal bars to indicate an item's level, as shown in Figure 5, Figure 6a uses a level marker. Each marker is roughly the same size in terms of height and width with its used to indicate the item's level hierarchy. As with layer bars, markers may be overlaid on top of item text so that the text underneath is visible, or alternatively, markers may be displayed as a background fill with text displayed on top of the background fill. Root directory 605 has a level marker furthest to the left indicating that this is the highest level with Parent directories 610 and 630 have level hierarchy. markers slightly offset to the right from the offset marker used with root directory 605. This change in offset indicates that the parent directories are in the next level of the hierarchy underneath the root directory. directory 615 has a level marker further to the right from the parent directories, indicating that the child directory is in the next, or third, level of the hierarchy. Finally, grandchild directories 620 and 625 have offset markers

10

15

20

25

30

indicating that they are in the last, or fourth, level of the hierarchy shown. Their vertical placement underneath child directory 615 indicates that the grandchild directories shown are underneath the child directory in the hierarchy.

In this example, a single expansion is shown so that selects parent B directory 630 using when the user selection arrow 601, any directories in the next layer of hierarchy underneath the Parent B directory displayed. In this case, child directory 635 is displayed in resulting window 602. Child directory 635 has a similar offset marker as that shown for child directory 615 indicating that these directories are in the same level of When child directory 635 is subsequently the hierarchy. selected using selection arrow 636, any subdirectories in underneath child directory 635 next layer In this case, resulting window 603 shows displayed. grandchild directories 640 and 645 with offset markers similar to those shown for grandchild directories 620 and 625 indicating that all grandchild directories are in the same level of the hierarchy. While the same shading is used for the offset markers, the markers and/or the underlying text can be colored or use different grayscales indicate the level and hierarchical relationships between items. Also, while a single-level expansion is shown in Figure 6a, a multi-level or other type of expansion could be used to display a all additional levels or a fixed number of levels when an item is selected by the user. Furthermore, emphasis of a particular item within the tree view control can be added using the techniques described in Figure 4.

5

10

15

20

25

30

Figure 6b shows two flat tree view controls using various shaped layer markers superimposed on tree view item to identify the hierarchical structure. In the example shown in Figure 6a, an edge of the rectangular layer marker is used to determine the level of the directory within the hierarchy. However, other shapes may readily be used to indicate the various levels of data. For example, window 650 shows upwardly-pointing triangular markers used denote an items position within the data hierarchy. highest level item, root directory 653 is shown with triangular marker 654 indicating its uppermost position within the hierarchy. Parent A directory 656 and Parent B directory 668 are shown with triangular markers 657 and 669, respectively. As the next level in the hierarchy, markers 657 and 669 are shown slightly indented from uppermost triangular marker 654. A third level of the Child hierarchy, illustrated by directory 659, has triangular marker 660 slightly more indented than the second level markers (657 and 669). Finally, the lowest level directories, Grandchild directory 1 (662) Grandchild directory 2 (665) have the most corresponding triangular markers (markers 663 and 666,

Furthermore, various shaped markers may be used to indicate a data item's level within the hierarchy. Window 670 illustrates the use of various shapes and indentations to indicate the level of the corresponding data. In window 670, diamond-shaped markers correspond to the first level of data, rectangular-shaped markers correspond to the

respectively). In window 650 and 670, point of the marker,

such as a center-point, may be used to note the level of

data items with regard to other data items.

10

15

20

25

30

second level of data, circular-shaped markers correspond to the third level of data, and triangular-shaped markers correspond to the fourth level of data. Root directory 673 has diamond-shaped marker 674 in a left-most position indicating that the root directory is a member of the first level of data. Parent A directory 676 and Parent B directory 688 are shown with rectangular markers 677 and 689, respectively, indicating that these directories are members of the second level of data. In addition, markers 677 and 689 are shown slightly indented from uppermost diamond-shaped marker 674. A third level of the hierarchy, illustrated by Child directory 679, has circular-shaped marker 680 slightly more indented than the second level rectangular-shaped markers (677 and 689). Finally, the lowest level directories, Grandchild directory 1 (682) and Grandchild directory 2 (685) have triangular (markers 683 and 686, respectively) that are the most indented markers in window 670, indicating that these directories are members of the lowest level of data.

In window 650 and 670, marker position, such as a center-point, as well as marker shape are used to note the level of data items with regard to other data items. addition, the use of different marker shapes in window 670 can be used with or without marker indentation to note the relative level of data items within the hierarchy.

Figure 7 is a high level flowchart showing item data being retrieved and displayed in a flat tree view control. Processing commences at 700 whereupon a starting point for the tree view is received (input 705). A level number is assigned to the starting node (step 710). When a tree view is initially started, the level number would be initialized

5

at 775.

to 0, however if the retrieved node is received as a selection from a currently displayed tree view, then the start node level would be determined by the node level of The level number is incremented (step the selected item. 715) and additional tree data is read for the level number The tree data may be read from a directory (input 720). table (i.e., a file allocation table), or a data file corresponding to a hierarchical set of information. display attributes, such as shading, coloring, offset bars and markers, and numeric level indicators are included (predefined process 725, see Figure 8 for further A determination is made as to whether processing details). additional levels of data need to be processed (decision 730). If additional levels of data need to be processed, decision 730 branches to "yes" branch 735 whereupon the level number is incremented (step 740), data for the next level is read (input 750), and display attributes are included (predefined process 725, see Figure 8 for further processing details) before looping (loop 760) back to decision 730. This looping continues until no more levels need to be displayed, at which time decision 730 branches to "no" branch 765 and the levels read and processed are displayed to the user (output 770) before processing ends

25 Figure 8 is a lower level flowchart showing shading and emphasis values being applied to a tree view control node. Processing commences at 800 whereupon display parameters, or preferences, are retrieved (input 805). For example, display parameters or preferences may indicate whether color or grayscale will be used to indicate levels of data, whether items are emphasized, whether offset bars or

10

markers are included, and whether numeric level indicators A determination is made as to whether a will be used. horizontal displacement, such as with an offset bar or is included (decision 810). Ιf displacement is included, decision 810 branches to "yes" branch 815 whereupon a shading begin point is determined based on the end point of the previous level shading coordinate (step 820). If this is the first layer in the hierarchy, then the shading begins at the left most coordinate used for shading. If a horizontal displacement is not needed, "no" branch 825 is taken bypassing the horizontal shading calculation. The next shading color or grayscale value is determined (step 830) based on the shading or color value used in the previous level. If only horizontal offset bars or marks is being used, the color or grayscale of all items may be the same. A determination is to whether the particular item is emphasized made as (decision 835). If the item is emphasized, decision 835 branches "yes" branch 840 whereupon the to highlighting preference is retrieved (input 845). This may include bolding or adding red color to important items, adding yellow highlighting to an error, etc. The retrieved emphasis is applied to the item (step 850). If no emphasis is being applied to the item, decision 835 branches to "no" branch 855 bypassing the emphasis steps. The shading or color, including any offset bars or markers, is applied to the item (step 860) so that the item's position within the hierarchy is visually indicated. Processing ends at return 890 which transfers control back to the calling routine (see Figure 7).

y. Ref. No. IBM-R104

Figure 9 illustrates information handling system 901 which is a simplified example of a computer system capable of performing the server and client operations described Computer system 901 includes processor 900 which is coupled to host bus 905. A level two (L2) cache memory 910 is also coupled to the host bus 905. Host-to-PCI bridge 915 is coupled to main memory 920, includes cache memory and main memory control functions, and provides bus control to handle transfers among PCI bus 925, processor 900, L2 cache 910, main memory 920, and host bus 905. bus 925 provides an interface for a variety of devices including, for example, LAN card 930. PCI-to-ISA bridge 935 provides bus control to handle transfers between PCI bus 925 and ISA bus 940, universal serial bus (USB) functionality 945, IDE device functionality 950, management functionality 955, and can include functional elements not shown, such as a real-time clock (RTC), DMA control, interrupt support, and system management bus support. Peripheral devices input/output (I/O) devices can be attached to various interfaces 960 (e.g., parallel interface 962, serial interface 964, infrared (IR) interface 966, keyboard interface 968, mouse interface 970, and fixed disk (HDD) 972) coupled to ISA bus 940. Alternatively, many I/O devices can be accommodated by a super I/O controller (not shown) attached to ISA bus 940.

BIOS 980 is coupled to ISA bus 940, and incorporates the necessary processor executable code for a variety of low-level system functions and system boot functions. BIOS 980 can be stored in any computer readable medium, including magnetic storage media, optical storage media,

flash memory, random access memory, read only memory, and communications media conveying signals encoding the instructions (e.g., signals from a network). In order to attach computer system 901 to another computer system to copy files over a network, LAN card 930 is coupled to PCI bus 925 and to PCI-to-ISA bridge 935. Similarly, to connect computer system 901 to an ISP to connect to the Internet using a telephone line connection, modem 975 is connected to serial port 964 and PCI-to-ISA Bridge 935.

While the computer system described in Figure 9 is capable of executing the invention described herein, this computer system is simply one example of a computer system. Those skilled in the art will appreciate that many other computer system designs are capable of performing the invention described herein.

One of the preferred implementations of the invention is an application, namely, a set of instructions (program code) in a code module which may, for example, be resident in the random access memory of the computer. required by the computer, the set of instructions may be stored in another computer memory, for example, on a hard disk drive, or in removable storage such as an optical disk (for eventual use in a CD ROM) or floppy disk (for eventual use in a floppy disk drive), or downloaded via the Internet or other computer network. Thus, the present invention may be implemented as a computer program product for use in a computer. In addition, although the various described are conveniently implemented in a general purpose computer selectively activated or reconfigured by software, one of ordinary skill in the art would also recognize that

10

15

20

25

such methods may be carried out in hardware, in firmware, or in more specialized apparatus constructed to perform the required method steps.

28

While particular embodiments of the present invention have been shown and described, it will be obvious to those skilled in the art that, based upon the teachings herein, changes and modifications may be made without departing from this invention and its broader aspects and, therefore, the appended claims are to encompass within their scope all such changes and modifications as are within the true spirit and scope of this invention. Furthermore, it is to be understood that the invention is solely defined by the appended claims. It will be understood by those with skill in the art that if a specific number of an introduced claim element is intended, such intent will be explicitly recited in the claim, and in the absence of such recitation no such limitation is present. For a non-limiting example, as an aid to understanding, the following appended claims contain usage of the introductory phrases "at least one" and "one or more" to introduce claim elements. However, the use of such phrases should not be construed to imply that the introduction of a claim element by the indefinite articles "a" or "an" limits any particular claim containing such introduced claim element to inventions containing only one element, even when the same claim includes introductory phrases "one or more" or "at least one" and indefinite articles such as "a" or "an"; the same holds true for the use in the claims of definite articles.
